

Rampdown Phase 2 Process

Rampdown Phase 2 (RDP2) is used to describe the time during which a particular jdk8u release enters stabilization mode. Timelines are communicated on the jdk8u-dev@openjdk.java.net mailing list when this occurs.

Only critical bug fixes should be considered as candidates for integration post RDP2. Examples may include regressions or serious functionality issues. A maintainer must coordinate with the appropriate stakeholders to determine whether a fix is suitable. In order to facilitate this you **MUST** either edit the bug in the bug database or work with a [maintainer](#) directly. In the latter case please provide the maintainer with the following:

- CR number you are working on
- Rationale for why the fix should be approved, including the benefit and risks involved, what testing has been done, and what the results were.

A fix with RDP2 approval must be pushed to 8u-dev by the requesting engineer (or sponsor). The maintainers are responsible for ensuring that the fix is included in the appropriate release.

In addition to the above, a phase 2 push approval request also needs to be filed. See the phase 2 template.

Note that the 8u-dev forest remains open for fixes during RDP2. Fixes to the 8u-dev forest follow the normal [approval template](#) process.
